ABSTRACT

A comparison is carried out, in both graphical and tabular form, over the energy range 0.1-100 keV between the National Bureau of Standards' data base of experimental x-ray attenuation coefficients (total absorption cross sections) and cross sections obtained using two sets of photoionization cross section values: the semi-empirical set of recommended values produced by Henke et al which covers the energy range .03-10 keV; and a theoretical set calculated by Scofield which covered the range 1-1500 keV and was extended by Scofield, at our request, to also cover the 0.1-1 keV range. There has been some disagreement over whether Scofield's results should be subject to renormalization from a Hartree-Slater to a Hartree-Fock atomic model. Therefore in the tables a comparison is made of Scofield's predictions both with and without this renormalization.

INTRODUCTION

The purpose of this study is to examine and present recommended values for cross sections of the interaction of x rays with atoms. We seek to use the NBS measured data collection to evaluate the status of our knowledge of x-ray attenuation cross sections between 0.1-100 keV by comparing the experimental data with cross sections obtained using a semi-empirical set of recommended values of the photoionization cross section and using a theoretical calculation of the photoionization cross section. Coherent and incoherent scattering cross sections are added to the photoionization cross section to obtain attenuation cross sections to compare with the experimental data.

The National Bureau of Standards (NBS) Photon and Charged Particle Data Center abstracts from the literature and computerizes values of experimental photon total attenuation

coefficients¹. By mid-1985 this collection included approximately 20,000 data points abstracted from about 500 independent literature sources. Photon energies in this file range from 10 eV to 13.5 GeV and 82 elements are included with atomic number from 1 to 94. There are about 2,500 points for energies 0.1-1 keV, 5,300 points for energies 1-10 keV, and 5,600 points for energies 10-100 keV. A bibliography² of this data collection is included in a separate internal report.

The semi-empirical set examined is that of Henke and coworkers³ which covers the energy range .03-10 keV. This is the most recent comprehensive compilation and is widely used. They interpolated and extrapolated from data in experimental data sets while being guided, to some extent, by experienced judgement and by theoretical calculations of Henry, Bates, and Veigele⁴ using a single electron Hartree-Slater model. However Henke et al. do not provide a comparison of their semi-empirical values with the experimental data. The Henke et al values used in the present comparison⁵ were in machine readable form and contained a finer grid of values than that of reference 3.

A tape of the theoretical photoionization cross section values, including the cross section values for the individual subshells, was provided to us by Scofield⁶. These values were tabulated for the 1-1500 keV range in his 1973 report⁷. Upon our request, Scofield extended his calculation down to 0.1 keV and

provided us with the results⁸ even though the validity of some of the assumptions used in the calculation might be expected to break down in this range. In Scofield's calculation the electrons are treated relativistically as moving in a Hartree-Slater central potential. On the basis of potential model calculations of Pratt and coworkers⁹, a renormalization procedure from Hartree-Slater to Hartree-Fock is suggested as possibly improving the results for atoms with atomic number less than 55. This renormalization procedure is applied to individual atomic shells and has its greatest effect for outer shells. At energies above 1 keV the renormalization changes the cross section generally by less than 10%. A sample of the percentage reduction of the total cross section at an energy of one keV is given in Table 1. At lower energies the effects are larger. Values are tabulated both with and without renormalization in this study as a means of determining the effect of renormalizing. The results for the 0.1-1 keV energy range (for which the effect is the largest of the three decades considered here) show that, on the whole, the unrenormalized results seem to agree better with the experimental results. It is these values which are plotted in the graphs. For energies under 1 keV, both coherent and incoherent scattering are quite small and they are consequently not included in the result. Above 1 keV, they are added to the cross sections of Henke and Scofield. There have been other recent calculations¹⁰ using less complex codes than Scofield's which have not been included in this comparison.

COMPARISONS

Tables 2A,B,C (see the appendix) show the experimental results and the corresponding interpolated values from Henke et al for the 0.1-1 keV and 1-10 keV ranges and the two versions of Scofield (with and without renormalization) for each of the three energy decades. The Henke et al values were obtained through the use of linear interpolation on total cross sections because his data were provided at closely spaced energy values while the Scofield values were obtained by natural cubic spline interpolation on the logs of the energy and the subshell cross sections for energies above 1 keV. For energies below 1 keV, Scofield's values were obtained by linear interpolation on the logs of the energy and the subshell cross sections (because the energy values provided by Scofield made the spline unstable in some cases). All cross section values are given in units of $10^{-24} \text{ cm}^2/\text{atom}$ (barns/atom). In the table the following abbreviations are used:

IZ or ILT	Atomic number of the element.
MSET	Accession number in the NBS data base.
NMAX	Total number of experimental points in data set.
REF	Reference code (see bibliography ²). If a five digit code is listed here, add a 0 before the last digit to obtain the code used in the bibliography.
NTAL	Number of distinct data points in 100-1000 eV range.
RMSDH	Root mean square deviation in percent of the values of Henke et al from the experimental data.
RMSDS	Root mean square deviation in percent of the values of the unrenormalized Scofield calculation from the experimental data.
RMSDSR	Root mean square deviation in percent of the values of the renormalized Scofield calculation from the experimental data.
N	Data point number.
E	Data point photon energy in eV.
ATEX	Experimental attenuation cross section.
ATTHH	Interpolated attenuation cross section from Henke. $(ATEX-ATTHH)*100/ATEX$.
PEH	Interpolated attenuation cross section from unrenormalized Scofield. $(ATEX-ATTHS)*100/ATEX$.
ATTHS	Interpolated attenuation cross section from renormalized Scofield. $(ATEX-ATTSR)*100/ATEX$.
PES	Interpolated attenuation cross section from renormalized Scofield. $(ATEX-ATTSR)*100/ATEX$.
ATTHSR	
PESR	

The figures display these data in graphical form for each of the three energy decades. In the plots the symbols represent experimental data points, while the solid line gives the result using Scofield's calculation (not renormalized), and the dashed line gives the values using the semi-empirical data set of Henke

et al. The indexes to the figures, Tables 3A,B,C, use the above abbreviations except that here Z is used for atomic number and N identifies the number corresponding to the symbol used to plot the referenced experimental data set. A separate key is used to relate the numbers to the symbols. Note that the symbols repeat themselves starting at N=20 and again at N=39.

The bibliography² lists all the references to the data sets in the NBS data base.

CONCLUSIONS

The comparison for the 0.1-1 keV range shows that the semi-empirical values are in reasonable agreement with the experimental data where the data exist. As can be seen from the figures and Table 2A (appendix), however, there are many elements for which good experimental data are lacking. Scofield's calculation does surprisingly well in an energy region where one might expect its underlying assumptions to begin to break down. It appears to be reasonably accurate down to 100 eV for atomic numbers up to about 35, down to 200 eV for atomic numbers up to about 60, with discrepancies gradually increasing as the atomic number increases. This may be seen in the figures. In the energy region where Scofield's calculation works, it also provides values for the cross sections of the individual atomic shells. In these regions the subshell values may also be valid but our comparison does not provide proof of this. Table 2A also suggests that the Scofield values without renormalization are in better agreement with the experiments than the renormalized values.

It is clear that more experimental and theoretical work is necessary to solidify our knowledge of the attenuation cross sections in the 100-1000 eV photon energy range. Scofield is currently working on an improved version of his theory which will avoid the renormalization problem.

The theoretical results are strictly valid only for free atoms. For molecules and solids there are differences, particularly near absorption edges. In condensed matter such effects as EXAFS (extended x-ray absorption fine structure) must be considered.

The comparison for the 1-10 keV range shows that the semi-empirical values and the theoretical values are in good agreement with each other and with the experimental data where the data exist particularly for elements with atomic number less than 55. Above Z=55 there are 10-20% differences between Henke and Scofield. It is difficult to generalize as to which data set to prefer from the scatter of the experimental points. As can be seen from Table 2B, however, there are several elements for which

good experimental data are lacking. Since the renormalization correction is relatively small, it is difficult to determine from Table 2B whether the unrenormalized Scofield values are in better agreement with the experiments than the renormalized values. We must rely on the more sensitive results from the lower energy decade.

The comparison for the 10-100 keV range shows excellent agreement between Scofield's calculation and the experimental data for atomic numbers greater than three. The experimental results at lower Z are questionable because of the sensitivity of the experiments to impurities in the samples due to the very low cross sections of these elements. As can be seen from Table 2C, the effect of renormalization is only about 1% in this range. Hence no conclusion can be drawn about the value of renormalizing from the data in this decade.

ACKNOWLEDGEMENTS

The authors wish to thank Dr. Martin Berger for his advice in carrying out this work. They are grateful to J. H. Scofield for providing his calculation in machine readable form for this study and to B. L. Henke for providing his semi-empirical cross sections. This work was supported by the National Bureau of Standards Office of Standard Reference Data.

APPENDIX TO

X-RAY ATTENUATION COEFFICIENTS (TOTAL CROSS SECTIONS):
COMPARISON OF THE EXPERIMENTAL DATA BASE WITH THE
RECOMMENDED VALUES OF HENKE AND THE
THEORETICAL VALUES OF SCOFIELD
FOR ENERGIES BETWEEN 0.1-100 KEV

E. B. Saloman and J. H. Hubbell
Center for Radiation Research
National Bureau of Standards
Gaithersburg, Maryland 20899

DATA USED IN THIS COMPARISON
PRESENTED IN TABULAR FORM

Table 2A	Data 0.1-1.0 keV.	A- 2
Table 2B	Data 1.0-10.0 keV.	A- 74
Table 2C	Data 10.0-100.0 keV.	A-215

TABLE 2A
DATA USED IN THE COMPARISON
FOR THE ENERGY RANGE 0.1-1.0 KEV

<p>11. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here)</p> <p>A comparison is carried out, in both graphical and tabular form, over the energy range 0.1-100 keV between the National Bureau of Standards' data base of experimental x-ray attenuation coefficients (total absorption cross sections) and cross sections obtained using two sets of photoionization cross section values: the semi-empirical set of recommended values produced by Henke et al which covers the energy range .03-10 keV; and a theoretical set calculated by Scofield which covered the range 1-1500 keV and was extended by Scofield, at our request, to also cover the 0.1-1 keV range. There has been some disagreement over whether Scofield's results should be subject to renormalization from a Hartree-Slater to a Hartree-Fock atomic model. Therefore in the tables a comparison is made of Scofield's predictions both with and without this renormalization.</p>
